## Black Marble Cost

Marble countertops are in the high-end price range for stone countertops. Their [long history](#) of being used in the home for rich families, famous artworks, and monuments has given marble a reputation among high society.

On average, marble countertops can cost between \$50-\$250 per sq. ft. to install. Black marble countertops are in the middle range of costing \$75 per sq. ft. to install.

Black marble countertops are a luxury item and will cost a bit extra to have within the home. That price alone just accounts for the stone and not the other factors which contribute to the price.

## Additional Cost Factors

The price for black marble countertops can depend on a number of additional factors which you will need to be aware of as these extra charges are what really makes black marble expensive.

## Rarity

Marble stone is typically found as a white stone with some light veining. Black marble stone is harder to find, making it more expensive than the regular white marble countertops. Depending on how much black marble has been quarried and supplied to stores, the price for black marble can substantially increase.

## Extraction

Due to the rarity of black marble countertops, quarries must be very delicate in extracting it from the ground. If they remove it incorrectly, the stone can break and will be unusable for marble slabs, needing to be broken down for other materials. The delicate process of removing the stone safely increases the price to fabricators, which in turn raises the price for homeowners like you.

## Quality

Marble stone is graded on an A-D ranking to determine the level of quality with each slab. The higher the letter, the better the grade, which means the better the stone slab will be receiving.

Grade	Quality	Explanation
Grade A	High Quality	Minimal flaws, light veining, subtle colors, strong durability, high cost
Grade B	High Quality	Minor flaws, some pitting and fissures, blotchy appearance, high-medium cost
Grade C	Medium Quality	Some flaws, pitting and fissures, large cracks, and chipping, may need repairs, lower price
Grade D	Low Quality	Heavily damages, bright colors, dark veins, minor to major flaws, will need repair, least expensive

This grading level was designed by the Marble Institute of America which grades every piece of marble to ensure customer satisfaction and financial security with purchases.

## Availability

Similar to black marble's rarity, if there is not enough black marble to meet the demand of clients, then it will cost more to purchase the black marble. The more available a stone is, the easier it will be to purchase it. When something is not available or highly requested, then it will increase the price for homeowners as the fabricators must pay more to meet the demand.

## Thickness

Marble stone is charged by how thick the stone is to install. Depending on how thick the stone is will affect the price you will be paying.

Thickness Lever	Description
1 cm. Thickness	Very thin, not advised for countertops, delicate, easy to damage and break, need additional support, good for large commercial projects
2 cm Thickness	Industry average, moderate strength, moderate stability, may need support for long overhangs, excellent for countertops and interior design
3 cm Thickness	Optimal thickness level, great stability, excellent durability, slightly more expensive
4 cm Thickness	Very durable, expensive, heavy to move, requires support, exceptional degree of protection and stability

When determining [how thick to buy marble countertops](#), take time to understand how often the marble will be used and what it will be used for.

## Finish

A finish is the process carried out on the surface of natural stone to give it a specific appearance or characteristics. Depending on what type of finish you choose will affect the overall price.

Type of Finish	Description
Polished	Most popular and commonly used, high glossy and shining appearance, typically comes with installation
Honed	Very popular, considered an upgrade and additional cost, countertop has a matte or satin-life appearance
Leathered	Expensive upgrade option where a diamond tipped brush removes softer parts of the marble to create a textured surface that feels smooth
Brushed	Additional charge where a wire brush is used on the surface to create a textured and slightly rough feel

## Labor and Installation

Marble is considered soft [compared to other stones](#). This means that laborers and fabricators must use caution when working with marble, otherwise they risk damaging it during transportation and installation. This excess care for general labor, transportation, handling, installation increases the price of black marble countertops.

Transportation is especially important since it takes time to load and move black marble stone from the warehouse to the jobsite. The farther the laborers have to travel, the more risk they are taking to keep the stone

intact.

## Project Complexity

Depending on how complex the installation is will also play a factor in the overall price. Simple countertop re-designs and installation will not cost much. But projects that require multiple cutouts, additional work, [specific edging](#) and backsplash material will all be additional charges.

## Popular Black Marble

We can keep talking about black marble countertops, but to truly understand how much they are worth, then you have to see what makes each stone special.

### [Black Marquina](#)

Black Marquina is a beautiful black marble stone with light white speckles and veins gently jutting across the slab. The deep black base of the stone makes the white speckles appear bright in the classic monochromatic color scheme which is very popular in modern interior designs.

### [Portoro Genuine Extra](#)

Portoro Genuine Extra is a combination of black and white colors melding together in an artistic amalgamation of patterns and designs. Every inch of this stone feels connected to the other pieces which feels like the white veins are flowing across the black stone slab.

### [Glaciers](#)

As the name suggests, Glaciers marble harkens back to the natural icy monuments of glaciers floating in the sea. The balance of bright and dirty white melding in layers with black and grey creates the natural look of ice and dirt forming on top of one another, which eventually breaks off to form a slab which can be used within your home.

## Final Verdict

So, the question is, how much are black marble countertops? The answer is it depends. On average, black marble countertops can cost around \$75 per sq. ft., but the additional factors will change the overall price.
