Granite is one of the top material choices for homeowners who are looking for natural stone countertops, backsplashes, vanity tops and other surfaces. Not only is the material known for being very attractive, it is also one of the most durable surfaces you can have in your house. Because of the similar durability you will get from many types of the stone, homeowners often ask: Isn't all granite the same? This article will help you find the answer to that question as well as provide you with additional helpful information to know when it comes to buying granite.

Isn't All Granite the Same?

The easy answer to the question above is a simple no. All granite is not the same. However, you may be wondering what exactly the differences are between different types of granite. The answer to that is much more in-depth and is analyzed below.

How Many Types of Granite Are There?

When browsing through a selection of [granite countertops](#), you will find that there is almost an endless amount of options to choose from. Granite is the natural stone option that will give you the most variety to choose from. There are over 2000 colors that you can choose from, not to mention the different patterns that are featured in different types.

How Does Granite Vary Between the Different Types?

There is significant variation between the many different types of granite. Whether you are looking for something that is dark, something that is light, something that features flecks and swirls or something that is more uniform, you will be able to find a type of granite that appeals to you. Other than color and patterns, there are different ways that types of granite can vary from each other.

Difference Between Types

The difference between types is clear: No two types of granite are exactly the same. In fact, since granite is a natural material, there are no two slabs of the stone that are exactly the same.

Difference Between Slabs

Granite is quarried from the earth, which means that no two slabs that are sent off to the fabricator are exactly the same. Even if it is the same type of granite or comes from the same area of the quarry, there will still be slight differences between individual slabs.

Is There a Difference in Price Between the Different Types of Granite?

Different types of granite will vary in price depending on a multitude of factors. In general, you can expect to pay somewhere around \$35 to \$75 per square foot for granite based on the type you choose.

What Factors Impact the Cost of Granite?

There are a few factors that you will need to consider when it comes to the cost of granite. These factors are listed in the following table and explained in further detail below.

Factors That Impact Cost

| |
|-------------------|
| Color |
| Availability |
| Material Quality |
| How Much You Need |

Color

The color of the granite you choose can help determine the cost. Some colors of granite are rarer, which drives up the price.

Availability

In general, the availability of the type of granite will impact its cost. Some types of the stone are more readily available than others, so they will be less expensive. Conversely, granite that is not commonly found will be in the higher section of the price range.

Material Quality

Not all granite that is quarried is of amazing quality. Some cuts of the stone may not be as strong as others, which can lessen the cost a little.

How Much You Need

How much granite you need for your job can also impact the overall cost. The more material you need, the more it will cost you.

If you found yourself asking, “Isn’t all granite the same?” now you know that the answer is a definitive no. There is much variation between the different types of the stone, even slabs that come from the same quarry. Regardless of which type of granite you choose, one thing is for certain: You will have a vast amount of options to choose from for your home remodeling project.
